

PHP Internship Homework Task

Some generous people are organizing fundraisers for various charities. There is only one problem: **they do not have a way of tracking donations.** To help them, you are going to create a CLI application (<https://www.php.net/manual/en/features.commandline.usage.php>) that will let them log donations to specific charities.

The donation should have the following fields:

- id
- donor name
- amount
- charity id
- date time

Charity should have the following fields:

- id
- name
- representative email

The application should have the following functionality:

- View charities
- Add charity
- Edit charity
- Delete charity
- Add donation

Requirements:

- Do not use any frameworks or packages.
- Do validation (valid email, donation, etc.)
- Write code using the best OOP practices.
- Add the ability to import charities in CSV format.
- Push your code to a Git repository (e.g., GitHub, GitLab, Bitbucket) and share the link with us.

Good luck!
